The *Journal of Organometallic Chemistry* publishes original papers, preliminary communications, subject reviews and annual surveys dealing with theoretical aspects, structural chemistry, synthesis, physical and chemical properties including reaction mechanisms, and practical applications, of organo-element compounds in a sense corresponding essentially to Section 29 ("Organometallic and Organometalloidal Compounds") of *Chemical Abstracts*.

Papers dealing with the following classes of compounds will be considered for publication:

(a) Compounds containing at least one direct bond between carbon and other elements excluding H, N, O, halogens and noble gases. Borderline cases can be expected among certain compounds containing S; these will be considered but not encouraged, and will be judged on their own merits. Carbonates and carbides will be excluded, as will also organometallic compounds in which the metal has no significant role.

(b) Metal hydrides and carbonyls.

(c) Metallocenes and similar complexes.

(d) In exceptional cases, compounds containing no direct carbon–metal (*c.q.* –metalloid) bond in the sense as described in (a) but which exhibit distinct organometallic character.

(e) New uses of compounds mentioned under (a)–(d) in synthetic organic chemistry, with the exclusion of their use for well-known routine purposes.

(f) Papers consisting wholly or mainly of reports of spectroscopic data (including fragmentation patterns from mass spectral studies) will be accepted only if the interpretation of such data have clear general implications.

Although manuscripts should preferably be sent to one of the Regional Editors, authors may prefer to submit their papers to one of the other members of the Editorial Board. If then considered as acceptable, the manuscript will be forwarded to a Regional Editor, who will decide on the final acceptance. A leaflet giving details about manuscripts, illustrations, reprints, etc. is available from the Publishers on request.

Comprehensive Chemical Kinetics

edited by

C. H. BAMFORD

and

C. F. H. TIPPER

The aim of this series is to cover in a critical way the practice and theory of kinetics and the kinetics of inorganic and organic reactions in the gas and condensed phases and at interfaces. Each chapter is written by an expert in the field so that the series as a whole will serve as a direct source of reference and information over the whole range of kinetics.
The vast amount of material scattered through the literature has never before been gathered together and presented in this accessible form.
